

RTM

Unified SCADA for Marseille metro lines

As part of a project to extend the M1 Marseille metro line and upgrade existing equipment, in 2010 the **Aix-Marseille-Provence Metropolitan Area** built a new **Network Supervision Center (CSR)** for the Marseille transport authority (RTM).

The RTM is an operator in the Aix-Marseille-Provence Metropolitan Area and **manages its urban transport networks**. The company is responsible for operation and supervision of the network, maintenance, security, marketing and after-sales service, customer information and ticketing management for the benefit of customers and the local authority..

RTM

in figures

- 12 heterogeneous subsystems
- 20 homogeneous operator consoles (HMI)
- 7,600 items of equipment
- 1,600,000 items of information /day
- 100 incident reports /day

Objective

In order to meet the technical challenges of transport today and in the future, the CSR was set up to provide centralized control of the two metro lines by integrating hypervision across all functions and the technical management of all equipment.

A function-specific hypervisor

The Metropolitan Area and Marseille transport authority have chosen to use the **Panorama E²** SCADA solution.

Why choose this **SCADA system**?

- Processing of 80,000 variables
- Global deployment of the **function-specific hypervisor** on all systems
- **Heterogeneity** of systems
- Pre-sales support as well as throughout the project
- **A proven solutions** for many different types of transport infrastructure (RATP, RER A, Metro in Lille, tram networks).

CSR Command and Control Room

The Network SCADA Center (CSR)

Considered as “the control tower” for the complete mass transit system, the CSR guarantees responsiveness to any incident that might occur on the network.

It brings together all Metro and Security control centers as well as Customer Information. It ensures continuity of customer service operations.

The benefits of centralized management

- Simplified network visualization: interface **ergonomics**
- **Faster response times** when incidents occur
- Improved real-time **information for customers**
- Fluid data exchanges between consoles
- Optimization of **operator work** through use of fully computerized equipment
- Better **traceability and coordination** of interventions on the ground
- Network **safety** and operating process **security**
- Better **management of internal tasks** (e.g. management of operating personnel)
- **Cost optimization** (elimination of carrying and maintenance costs)
- **Simplified authentication** on operator consoles

This **Unified SCADA System** allows centralized control of two metro lines.

The Aix-Marseille-Provence Metropolitan Area and RTM continue to demonstrate their confidence in this unified SCADA solution.
